

# Sprint Cycle 0 - Team Setup and Project Preparation

---

## Capstone Project

### Purpose

The purpose of Sprint Cycle 0 is to prepare the team to begin development. During this cycle, the team will review the project requirements, select its development technology, establish the shared GitHub repository, verify that every team member can work with the repository. **No project functionality will be implemented during Sprint Cycle 0. The User Interface Design and Database Design will be completed in later sprint cycles.**

### Sprint Cycle 0 Deliverables

#### 1. Review the Functional Requirements

- Read the complete Functional Requirements document as a team.
- Identify questions, unclear requirements, or possible conflicts that should be discussed with the instructor.
- Make sure every team member understands the five system roles and the major use cases.

#### 2. Select the Development Technology

- Choose the programming language, framework, database technology, and development environment the team plans to use.
- Identify how the application will be run by each team member.
- Identify the testing framework or testing mechanism that is available for the selected technology. No automated tests are required in Sprint Cycle 0.

#### 3. Create the Team GitHub Repository

- Create one shared GitHub repository for the project.
- Add every team member as a collaborator.
- The repository will be the official project repository for the remainder of the course.
- Project work that is not in the repository will not be considered part of the official project.

#### 4. Create the Initial Repository Structure

- Add a README file containing the project name, team members, project description, selected technology, and basic setup instructions.
- Create appropriate folders for source code and project documentation.
- Do not add project-specific functionality during this sprint.
- 

### Individual Student Requirements

**Every student must personally complete the following. One student may not perform these steps for the entire team.**

1. Accept access to the team's GitHub repository.
2. Clone the repository into the student's own development environment.
3. Pull the current version of the repository.
4. Make one small, nonfunctional contribution to the repository.
5. Commit the contribution using the student's own GitHub account.
6. Push the contribution to GitHub.
7. After all team contributions have been completed, pull the current version again and verify all changes

#### Examples of acceptable Sprint Cycle 0 contributions include:

- Add or correct information in the README.
- Add a team member's information to a team document.
- Add setup instructions for the selected development environment.
- Add a project description or technology-selection document.
- Add a nonfunctional documentation file or project folder.

## GitHub Verification

The purpose of the GitHub requirement is to ensure that the repository is the team's actual working project, not a backup maintained by one team member.

| Student       | Repository Verification               | Evidence                              |
|---------------|---------------------------------------|---------------------------------------|
| Team Member 1 | Clone / Pull / Change / Commit / Push | GitHub activity + pull/run screenshot |
| Team Member 2 | Clone / Pull / Change / Commit / Push | GitHub activity + pull/run screenshot |
| Team Member 3 | Clone / Pull / Change / Commit / Push | GitHub activity + pull/run screenshot |
| Team Member 4 | Clone / Pull / Change / Commit / Push | GitHub activity + pull/run screenshot |
| Team Member 5 | Clone / Pull / Change / Commit / Push | GitHub activity + pull/run screenshot |

**Each student should submit or provide the team with:**

- A screenshot showing a successful pull of the current repository. GitHub evidence showing at least one push or commit made from the student's own GitHub account during Sprint Cycle 0.

## Team Organization

- Choose a Scrum Master for Sprint Cycle 0.
- The Scrum Master coordinates meetings, tracks progress, records decisions, and communicates with the instructor.
- The Scrum Master does not perform all technical work for the team.
- All team members are responsible for understanding the project requirements, selected technology, repository workflow, and how to run the application.

## Sprint Cycle 0 Demonstration

During the Sprint Cycle 0 demonstration, the team must show:

8. The selected development technology and development environment.
9. The GitHub repository and repository structure.
10. The README and setup instructions.
11. GitHub activity showing a contribution from every team member.
12. Evidence that every team member cloned/pulled the repository. Any requirement questions that must be resolved before Sprint Cycle I.

## Submission

- GitHub repository link
- README/setup instructions
- Technology selection summary
- Individual GitHub verification evidence for each team member
- Sprint Cycle 0 presentation
- Meeting documentation required by the course

## Sprint Cycle 0 Restrictions

- Do not implement project-specific use cases.
- Do not implement authentication or authorization.
- Do not implement project-specific database tables or collections.
- Do not implement the project's final user interface.
- Do not allow one team member to keep the only working copy of the project.
- Do not use ZIP files or file sharing as the normal method for combining project work.
